Elements of writing - persuasive essay

Write a persuasive essay responding to ONE of the prompts below. Highlight your choice of prompt. Make an outline. Be sure to use solid mechanics, firm structure, and be clear, reasonable, and engaging. 450-568 words.

1. What is the most important invention in history? Why has it been so important? What has been its overall effect on the world?
  2. Who is the worst teacher you ever had? Why were they so bad? What were their biggest problems?
- 

Outline:

LT: The most important invention in history is the toilet

TS1: Toilets prevented many diseases from spreading

CD: CDC evidence

TS2: Toilets made cities more sanitary

CD: no poop on streets - could u imagine stepping on poop wherever you went

TS3: Toilets have evolved!

CD: TOTO butt washer toilets

Words cool to use: overlooked, underrated

Every year on November 9th, World Toilet Day is celebrated. On this ~~very~~ notable day, people celebrate toilets and educate other people about the global sanitation crisis. When people answer what the most important invention in history is, they will probably ~~say something like answer:~~ smartphones, the internet, or cars; ~~however,~~ but by far, the most crucial invention of all time is the toilet.

The first reason why the toilet is the most important invention is because it has decreased the chance for ~~people~~ citizens to get sick. According to [CDC.gov](https://www.cdc.gov), "Without clean, safe toilets, human waste (poop) can contaminate communities' food and water sources, which increases peoples' chances of getting sick." If one person pees in the community water source, the whole community might drink the polluted water and subsequently get sick from cholera and typhoid, which are dangerous diseases that infect humans. This shows that toilets are an important part of ~~modern life~~ the world because they ~~help~~ reduce the chances of ~~getting~~ feeling ill.

The second reason the most vital invention is the toilet is because it transformed cities and made streets more sanitary. Before the first toilet was invented, undeveloped human beings pooped anywhere they ~~possibly~~ could. ~~Damp, brown piles~~ Brown damp substances in the shape of ice cream were scattered in cathedrals and churches, making ~~church on~~ people's experience of Sunday church intolerable. ~~Because of the amount of waste~~ Therefore, villages and communities emitted a foul smell that also made the ~~residents~~ citizens smell disgusting as well. However, ~~this monstrous situation~~ all of this monstrosity changed when the earliest toilet was ~~invented~~ introduced by an inventor. According to [History.com](https://www.history.com), a Scottish innovator named Alexander Cumming created the first flush toilet in 1775. Although it doesn't look as ~~effective~~ favorable as a modern toilet today, the toilet made cities more hygienic and clean. The invention of the toilet ~~displaced~~ ~~erased~~ the excreta from streets and improved ~~urbancity~~ city sanitation, so...

The final reason the toilet is the most significant invention in history is because it has evolved from just a facility into a piece of technology. The original toilets were made of either damp, disgusting wood or icy-cold stone that was obviously uncomfortable for the gluteus maximus; and the way to flush the excrement out of sight was by pulling a lever. However, ~~as~~ many inventors improved and perfected the design of the toilet, ~~so~~ it became ~~much better~~ a piece of technology, rather than a ~~rudimentary machine~~ facility just used to get rid of

poop. As seen in five-star hotels and malls, the ~~mass~~ majority of ~~high~~well-quality toilets ~~were~~ made by the Japanese company TOTO. One of the toilets in TOTO's line-up is called the Washlet+. According to [TOTO's website](#), the Washlet+ is ~~claimed to be~~ the "new standard of comfort and cleanliness for daily life." The main selling point for the Washlet+ is its sleek white design with a slightly curved toilet flap, and the most underrated feature of all, the heated seat. The heated seat improves the quality of your pooping experience and allows you to feel comfortable and warm during ~~those~~ chilly winter nights; whereas earlier versions of toilets were ~~much less~~not comfortable. To conclude, ~~these~~ fancy upgrades have made toilets develop from boring and stinky plumbing fixtures ~~facilities~~ to much more advanced ~~and comfortable modern conveniences~~toilets.

In summary, toilets have lowered the chances of ~~getting~~ diseases, made cities more sanitary, and evolved from a facility to a piece of technology; thus the toilet is the most remarkable invention in the world. Even though other inventions may seem more interesting, toilets are often overlooked as an essential invention throughout the world.

Rewrite:

Every year on November 9th, World Toilet Day is celebrated. On this notable day, people acknowledge the importance of toilets and educated people about the Global Sanitation Crisis, which is an event people face in sanitation issues globally. When people answer what the most important invention in history is, they will probably say something like smartphones, the internet, or cars; however, by far, the most crucial invention of all time is the toilet.

The first reason why the toilet is the most important invention is because it has decreased the chance for people to get sick. According to [CDC.gov](#), "Without clean, safe toilets, human waste (poop) can contaminate communities' food and water sources, which increases peoples' chances of getting sick." If one person pees in the community water source, the whole community might drink the polluted water and subsequently get sick from cholera and typhoid, which are dangerous diseases that infect humans. This shows that toilets are an important part of modern life because they reduce the chance of getting ill.

The second reason the most vital invention is the toilet is because it transformed cities and made streets more sanitary. Before the first toilet was invented, dumb human beings pooped anywhere they could. Damp, brown piles in the shape of ice cream were scattered in cathedrals and churches, making church on Sunday intolerable. Because of the amount of waste, villages and communities emitted a foul smell that also made the residents smell disgusting as well. However, this monstrous situation gradually changed when the earliest toilet was invented. According to [History.com](#), a Scottish innovator named Alexander Cumming created the first flush toilet in 1775. Although it doesn't look as effective as a modern toilet today, the toilet made cities more hygienic and clean. The invention of the toilet displaced excreta from streets and improved urban sanitation, proving to be the best invention in history.

The final reason the toilet is the most significant invention in history is because it has evolved from just a plumbing fixture to an intricate piece of technology. The original toilets were made of either disgusting wood or icy-cold stone that was obviously uncomfortable for the gluteus maximus; the way to flush the excrement out of sight was by pulling a lever. However, many inventors improved and perfected the design of the toilet, so it became much better, rather than a rudimentary machine just used to get rid of poop. As seen in five-star hotels and malls, many high-quality toilets are produced by the Japanese company TOTO. One of the toilets in TOTO's line-up is called the Washlet+. According to [TOTO's website](#), the Washlet+ is the "new standard of comfort and cleanliness for daily life." The main selling point for the Washlet+ is its sleek white design with a slightly curved toilet flap, and the most underrated feature of all, the heated seat. The heated seat improves the quality of your pooping experience and allows you to feel comfortable and warm during chilly winter nights; whereas earlier versions of toilets were much less comfortable. To conclude, fancy upgrades have made toilets develop from boring and stinky plumbing fixtures to much more advanced and comfortable modern conveniences.

In summary, toilets have lowered the chance of disease, made cities more sanitary, and evolved from a plumbing fixture to a piece of technology; thus the toilet is the most remarkable invention in the world. Even though other inventions may seem more capable and advanced, toilets have been overlooked for many years.
